I would rank the articles in this order:

1. Revenge. I agree that some people commit cybercrimes for revenge on people. A lot of people go online and try to get after people who did something. Usually, people commit cyberbullying when they're trying to get revenge. But most of the smart ones in the world do worse things.

2. Boredom. I agree that people commit cyber crimes because they're bored. People are sitting at their computers every day just bored. With no friends, no money, and no social life at all. That's when I believe they just decide to commit crimes.

3. Politics. This article makes sense to me. Young adults are using cyber to make political points to the U.S. government. The only part that doesn't make sense to me is how young people care about politics. I don't know anybody my age right now (19) who is deep into politics. That's usually what older people are into.

4. For money. The article makes sense to me but I don't agree with some of the stuff stated. I think when most people commit cybercrimes and they're successful they are spending their money on big-ticket things which is why they get caught. I do believe they invest and use the money for other things though.

5. Multiple reasons. I agree that cybercriminals are financially motivated. But I don't think that connects to psychological factors.

6. Recognition. This article makes no sense. I understand what the person did and all the charges that were thrown at him. But it just looks made up to me.

7. Entertainment. This article makes zero sense. It was said in the article that many professionals argued that it isn't a security breach if the date is public. I don't know how

that has anything to do with entertainment. Is the reason why people entertain themselves by collecting lots of public data?
