

Week 2 – Journal Entry 2

Empiricism has enhanced cybersecurity practices by not relying on what could happen. By using actual evidence and statistics employees can act on it and create a better security system and even anticipate future events from the current information they have.

If they were to go based off intuition, they could be making security for something that may or may not happen often. It is almost like they are gambling. Cybersecurity threats are constantly evolving and if we are not actively keeping track of their activities they could have serious consequences for a company.

I feel like it is important to not go off hunches and stick to the statistics that are provided in many fields not just cybersecurity.
