

Meme #1

Me turning on my VPN, not knowing that my device can still be infected with malware.

Explanation: This is a common misconception that VPNs allow people to stay safe online. People should still be wary and avoid malicious links and phishing emails.

Meme #2

Me getting ready to type my new password123456 (My old one was hard to remember)

Explanation: Even though 123456 is an easy password to remember, it should not be used as it is too easy. The person should choose a more random password and get used to it to decrease the chances of people unlocking their phone if it were ever to be lost or stolen.

Meme #3

My manager consulting me after I click a fake company email the 6th time this week.

Explanation: Employees should undergo proper training so that things like phishing scams aren't interacted with.
