

Week 3 – Journal Entry 3

I have looked at the data breaches from Quarter 1 of 2025, and there are reportedly 658 identified breaches in the year so far. Many of these breaches were caused by hacking incidents (61%) while the rest were categorized as unknown (31%).

With this information researchers could maybe update their catalogs so that they can label what kind of threats were unknown. This would be beneficial so that the right form of action can be taken against an attack method instead of lacking the knowledge to do so.

Healthcare organizations had a big impact that affected about 4.7 million people, so figuring out what specific hacking incidents are causing this such as phishing, the company could have their employees trained against that specific hacking method.
