

The certain areas that I would want to focus my career on is more in the Cyber defense analyst field. What appeals me most to that field is having to be able to Ensure that cybersecurity-enabled products or other compensating security control technologies reduce identified risk to an acceptable level. Also, having to use cyber defense tools for continual monitoring and analysis of system activity to identify malicious activity. What appeals me least is having to know the network security architecture concepts including topology, protocols, components, and principles.
