CYSE 200

4/16/2020

I believe the biggest challenge for cybersecurity and cyberspace in 20 years will be to keep law and peace to the cyber space. I believe as the cyberspace continue to grow, more and more people will act above the law, creating an anarchy like space in the digital world. For example, if there aren't more strict laws on the cyber space or anyone to enforce said laws, someone maybe be able to steal important information form anyone they want, or even steal something like an autonomous car.

I would advise policy makers to create almost like a cyber space constitution or bill will all the laws of the domain. With this there should be a enforcement body dedicate to just protecting and enforcing the laws of the cyber space. If we were to relate the real world to the cyber space there is rules and regulation in the real world's different domains such as air traffic need to occur at certain levels, you can only fish in certain areas at certain times of the year.

Like I mentioned before, legislation could approach this in a constitutional manner, making a strict outline of rules and regulations for cyber space. They could create a new agency or police force just for cyber space, like the FBI but separate so their sole focus can be on the cyber space. They could regulate things like where people can and can't go, and how much freedom people have on the internet to do whatever they want.
