Benefits of a VPN:

1. Enhanced security. When connected to a VPN the data is kept secured and encrypted.
2. Online anonymity. You can browse anonymously while connected to a VPN.
3. Unblock websites and bypass filters. VPN have the ability to make it appear you're in a different country so you can watch a show that is only viewed in Japan from your home in America
4. Change the IP address. Like I said before, the VPN can change the IP address to make it appear that you're in a different country
5. Better performance. Bandwidth and efficiency of the network can be increased with a VPN

Disadvantages of a VPN:

1. VPN's are Illegal in some countries. Some countries consider private networks to be illegal
2. The Service you get the VPN from could be monitoring your data and use the data. Much like how the Alexa records your conversations VPNs may record your keystrokes and data you access.
3. It may add more cost to your network connection. VPNs are a premium private connection service that you must pay for on top of your normal internet bill.
4. 100% anonymity cannot be guaranteed. VPN can disconnect without you knowing and you'll no long be anonymous
5. There could be platform compatibility issues from a less popular or well know platform.
