

## Part I: Check Your File System (20 Points)

Submit screenshots for each command output in this part

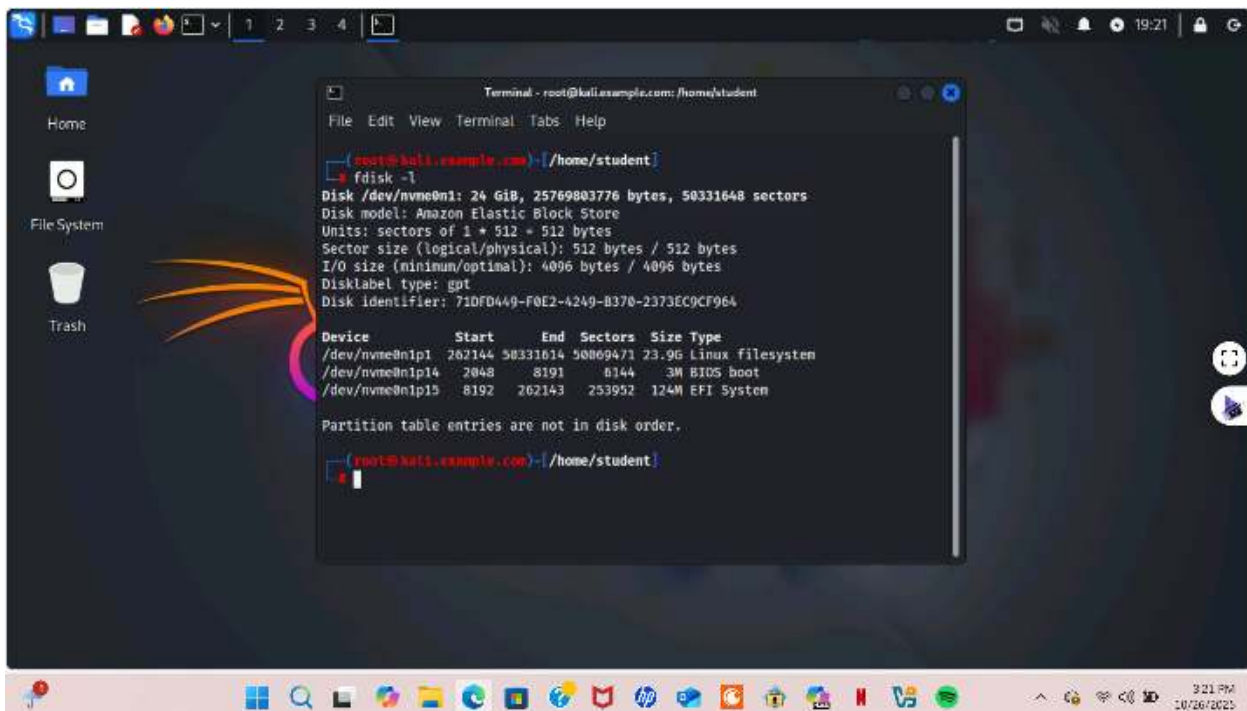

Step 1. Execute the `ls /dev/sd*` command to see the current hard disk devices.

The screenshot shows a terminal window titled "Terminal - root@kali.example.com: /home/student". The user has executed the command `ls /dev/nvme*`, which returns the following output:

```
(root@kali.example.com)-[/home/student]
└─$ ls /dev/nvme*
/dev/nvme0 /dev/nvme0n1 /dev/nvme0n1p1 /dev/nvme0n1p14 /dev/nvme0n1p15
└─$
```

Step 2. Execute the `fdisk -l` command to list the current hard disk partitions.

The screenshot shows a terminal window titled "Terminal - root@kali.example.com: /home/student". The user has executed the command `fdisk -l`, which returns the following output:

```
(root@kali.example.com)-[/home/student]
└─$ fdisk -l
Disk /dev/nvme0n1: 24 GiB, 25769803776 bytes, 50331648 sectors
Disk model: Amazon Elastic Block Store
Units: sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 4096 bytes / 4096 bytes
Disklabel type: gpt
Disk identifier: 71DFD449-F0E2-4249-B370-2373EC9CF964

Device            Start      End  Sectors  Size Type
/dev/nvme0n1p1    262144    58331614 50069471 23.9G Linux filesystem
/dev/nvme0n1p14    2048      8191     6144     3M BIOS boot
/dev/nvme0n1p15    8192     262143   253952   124M EFI System

Partition table entries are not in disk order.

└─$
```

Step 3. Execute the `parted -l` command to list the current hard disk partition table.

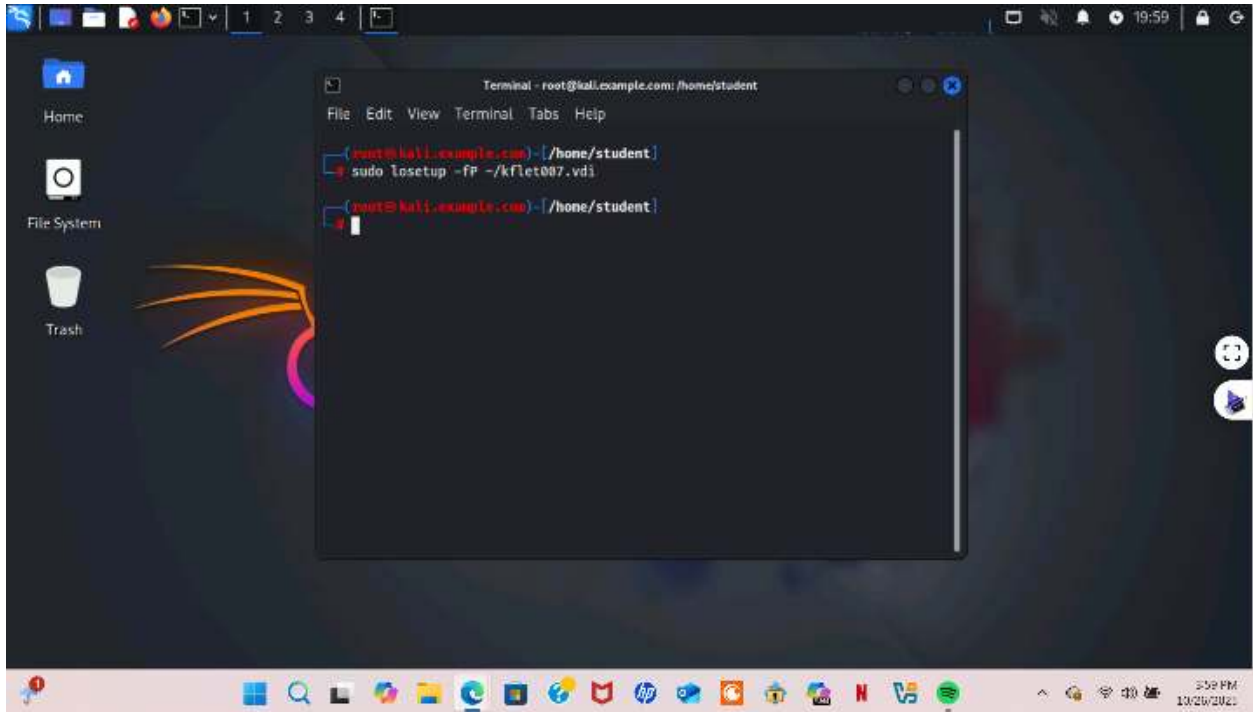

## Part II– Create a new virtual disk file (20 points)

Step 1: Create a Virtual Disk File. Run this command to create a 200 MB virtual disk file. Replace YourMIDAS with your MIDAS ID.

```
sudo dd if=/dev/zero of=~/.YourMIDAS.vdi bs=1M count=200
```

Step 2: Attach the Virtual Disk as a Loop Device

Step 3: Repeat Part I Commands and Highlight Differences

```
Terminal - root@kali.example.com: /home/student
File Edit View Terminal Tabs Help

[root@kali.example.com]~/home/student
└─# ls /dev/nvme*
/dev/nvme0 /dev/nvme0n1 /dev/nvme0n1p1 /dev/nvme0n1p14 /dev/nvme0n1p15

[root@kali.example.com]~/home/student
└─# sudo fdisk -l
Disk /dev/nvme0n1: 24 GiB, 25769803776 bytes, 50331648 sectors
Disk model: Amazon Elastic Block Store
Units: sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 4096 bytes / 4096 bytes
Disklabel type: gpt
Disk identifier: 71DFD440-F0E2-4249-B370-2373EC9CF964

Device            Start      End  Sectors  Size Type
/dev/nvme0n1p1    262144    50331614 50069471 23.9G Linux filesystem
/dev/nvme0n1p14      2048         8191    6144    3M BIOS boot
/dev/nvme0n1p15     8192    262143    253952   124M EFI System

Partition table entries are not in disk order.

Disk /dev/loop0: 200 MiB, 209715200 bytes, 409600 sectors
```

```
Terminal - root@kali.example.com: /home/student
File Edit View Terminal Tabs Help

[root@kali.example.com]~/home/student
└─# sudo parted -l
Model: Amazon Elastic Block Store (nvme)
Disk /dev/nvme0n1: 25.8GB
Sector size (logical/physical): 512B/512B
Partition Table: gpt
Disk Flags:

Number  Start   End     Size    File system  Name  Flags
 14     1049kB  4194kB  3146kB                bios_grub
 15     4194kB  134MB   138MB    fat16         boot, esp
 1      134MB   25.8GB  25.6GB   ext4

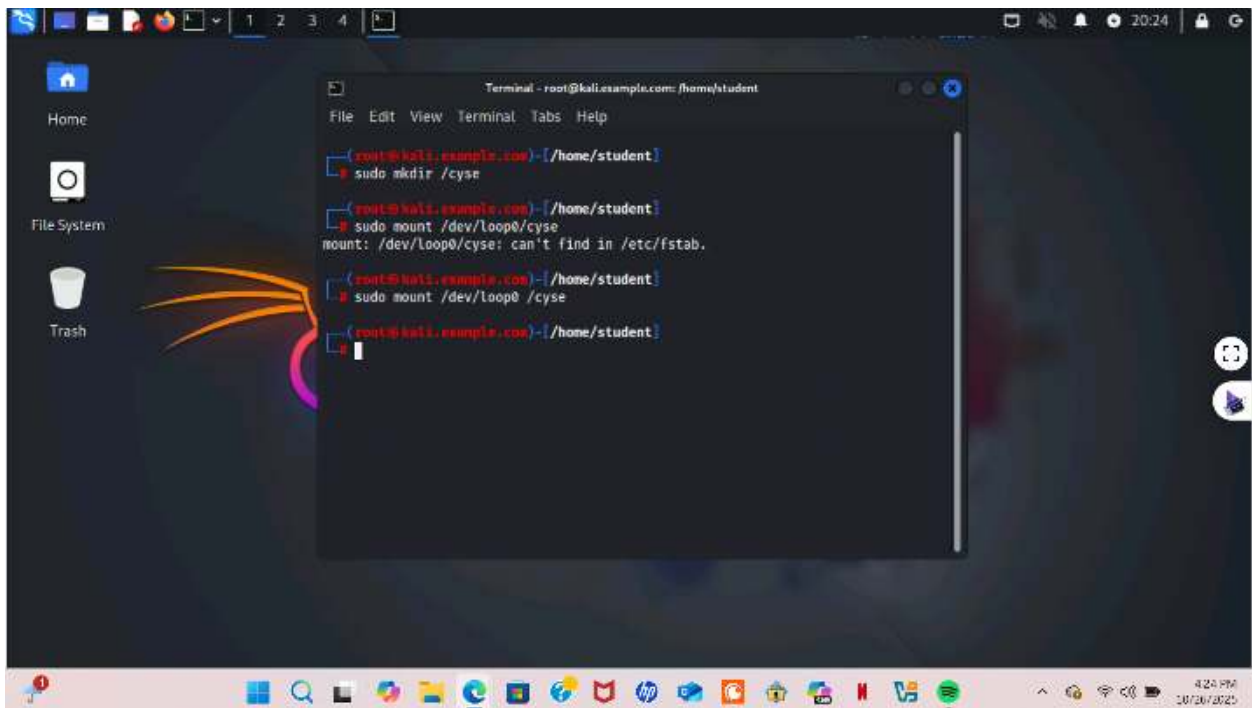

[root@kali.example.com]~/home/student
└─#
```

### Part III: Creating Filesystems and Mounting the Virtual Disk

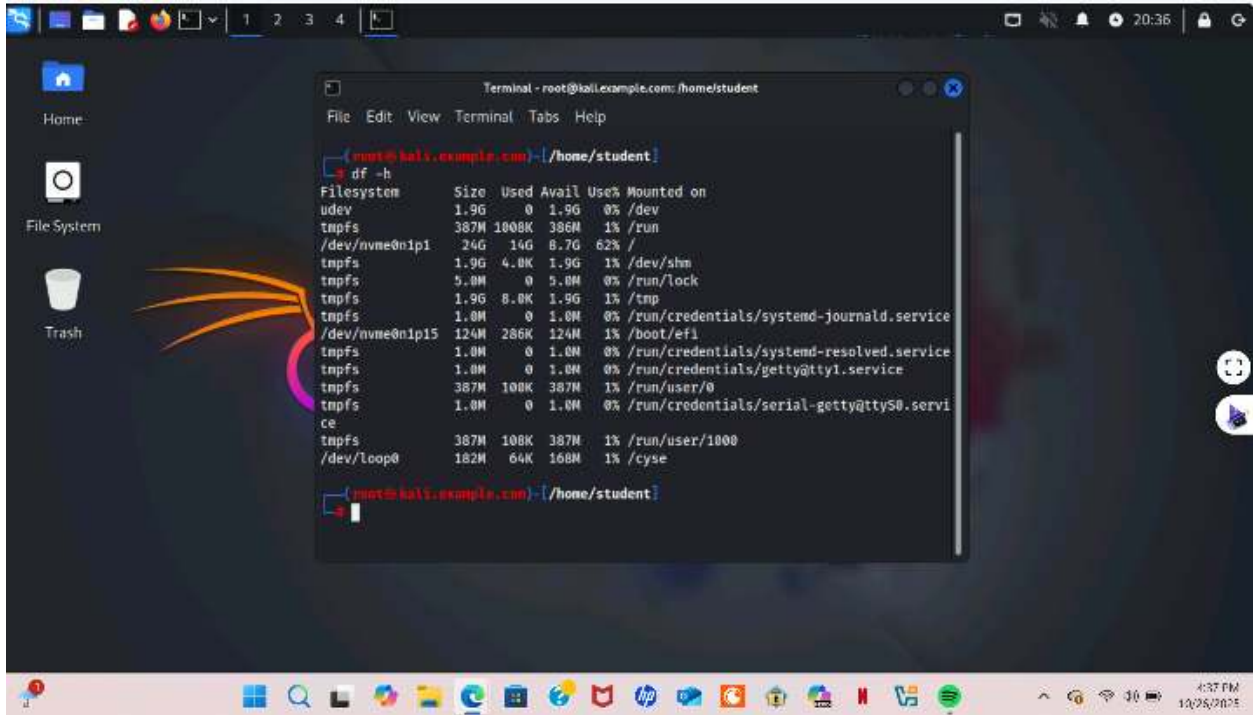

#### Step 1: Format the Loop Device Directly

## Step 2: Mount the Loop Device

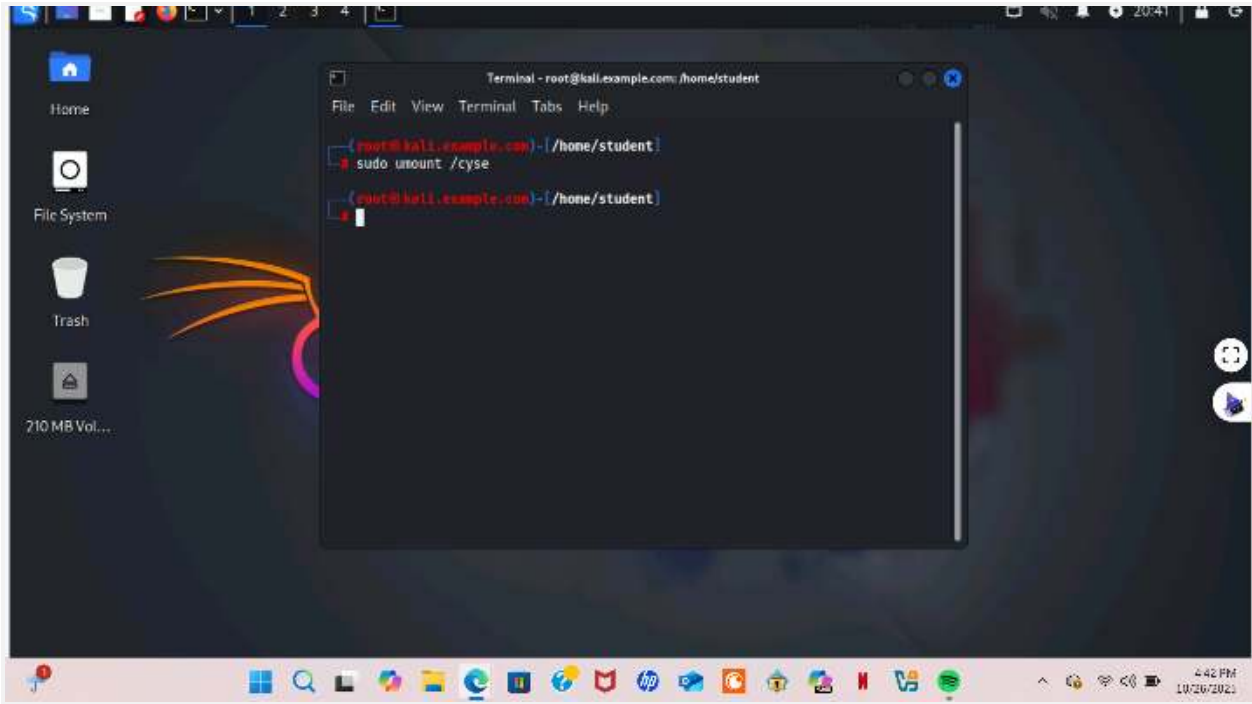

## Step 3: Check the Mount Point

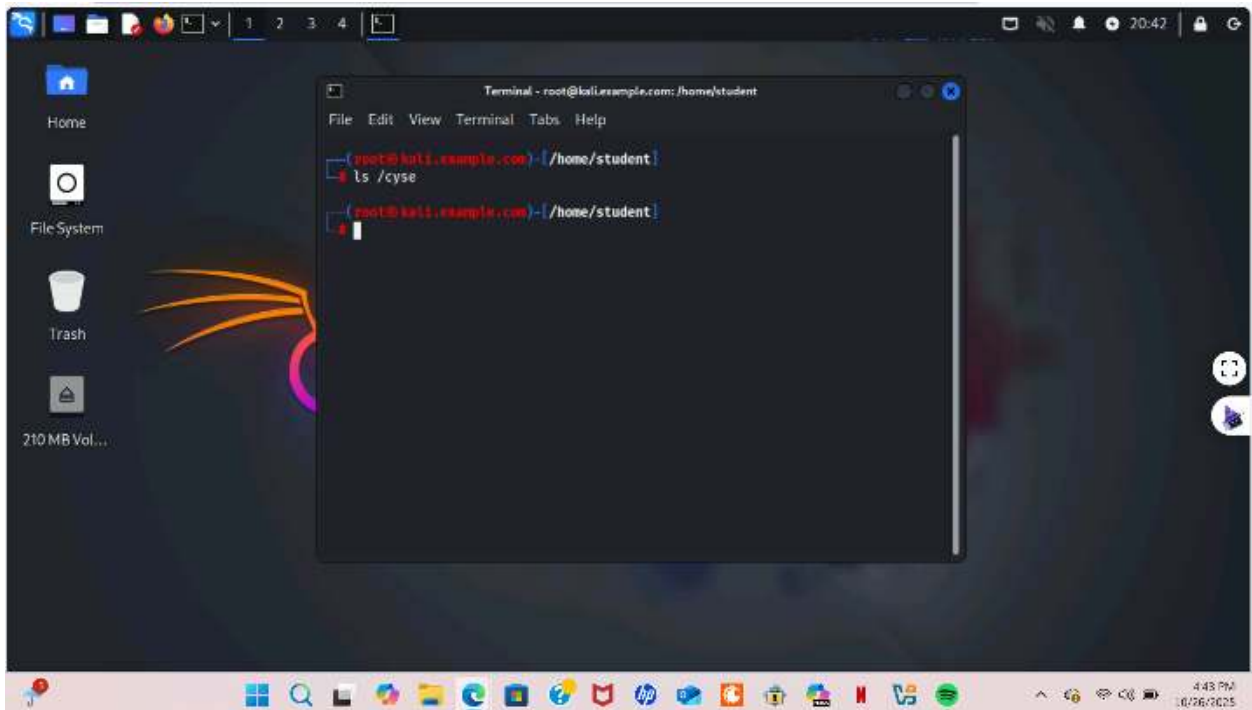

Step 4: Create a File Named YourMIDAS.txt

Step 5: Unmount the /cyse Directory

Step 6: Check the Contents of /cyse

Part I

V:

Answer the following questions

## (30 Points)

1.

Explain the purpose of using the `sudo` command with `ls /dev/sd\*` and `ls /dev/nvme\*`. Why is administrator privilege required in this context?

When you run `ls /dev/sd*`, it lists all device files in `/dev` that start with `sd`, which typically represent storage devices like hard drives and SSDs. These device files often have restricted permissions to prevent accidental modification or access by regular users. Using `sudo` before the command elevates your privileges, enabling you to see all device files, including those with restricted permissions, and gather comprehensive information about storage devices.

2.

What is a loop device, and why do we use `losetup` to attach the virtual disk file as a device in this lab?

A loop device is a pseudo-device in Linux that allows a file to be treated as a block device, essentially enabling the system to access a file as if it were a physical disk.

The `losetup` command is used to attach a file to a loop device. It sets up the mapping between the file and the loop device, making the file accessible as a block device.

3.

Why do we format the virtual disk using `mkfs.ext4`? Explain what this command does and why we chose the `ext4` filesystem specifically.

The command `mkfs.ext4` is used to format a storage device or partition with the `ext4` filesystem, which is a widely used journaling file system in Linux environments. When you run this command, it initializes the disk or partition by creating the necessary filesystem structures, such as inodes, directories, and data blocks, enabling the operating system to store and retrieve files efficiently.

4.

After mounting the virtual disk to `/cyse`, what changes should you observe in the output of `df -h`? Explain how `df` helps. When you mount a virtual disk to `/cyse`, the `df -h` command should display the new disk's filesystem information, including its size, used space, available space, and mount point.

Specifically, you should see an additional line in the output that corresponds to `/cyse`, indicating that the system recognizes the disk as mounted at that location.

5.

Why is it important to unmount a directory (like `/cyse` in this lab) before detaching a virtual disk? What could happen if you detach a disk without unmounting it first?

Unmounting a directory before detaching a virtual disk is crucial to ensure data integrity and prevent potential data loss or corruption. When a filesystem is mounted, the operating system manages read/write operations between the disk and the system.

6.

After creating a file on the mounted virtual disk and then unmounting the disk, what do you expect to see when you check the contents of `/cyse`? Explain why this happens.

When you create a file on a mounted virtual disk, the file is stored on that specific disk, and its contents are accessible through the mount point directory.

7.

How does using a virtual disk file differ from using a physical disk partition on your system? What are some advantages and disadvantages of using virtual disks in cybersecurity labs?

Using a virtual disk file differs from using a physical disk partition in that a virtual disk is a file stored on an existing physical disk, which emulates a separate storage device. This virtual disk can be mounted, formatted, and used like a physical disk, but it resides entirely within a file on the host system. Advantages of virtual disks in

cybersecurity labs include flexibility and ease of management.'

This lab It was pretty quick and only took a little time. I learned about the virtual disk  
Also just about the file system as well. This lab wasn't too much on the hard side and  
Also in overall just a pretty basic assignment.
