

I am a biomedical sciences pre-health major, with an overall goal of attending medical school, completing an MD program, and becoming an OBGYN. The cell I chose to draw is an ovum, a eukaryotic reproductive cell. I feel that it is one of the most important cells, not only in the field of Obstetrics but in the field of biology as a whole. The ovum, after fertilization, marks the start of life, contributes genetic material to the zygote, and helps doctors understand fertility. Conception, pregnancy, and childbirth cannot occur without this cell, making it vital to the field of Obstetrics.
