William Redman

CYSE 201S

Dr. Leigh Armistead,

January 20, 2023

I believe that the principles of science relate to cyber security because they are both attempting to simplify and contextualize something that is very complex. Social science is much more than just numbers and data, it has many aspects and incorporates human behavior and the personal choices individuals make. This heavily relates to cybersecurity, because cyber security is not just numbers and mechanical systems. It is interdisciplinary, it evolves and incorporates many aspects from STEM to psychology of humans and the mysteries of what consciousness really is and what drives humans to make the decisions they make. I think cybersecurity and social science go beyond just the STEM portion of science and venture into new possibilities, as the society we live in changes and adapts to new technology.
