## Data Breaches

Privacyrights.org offers a variety of information about data breaches specifically for the public. A data breach is an unauthorized user's exploitation of an organization's databases. This is commonly done by threat actors using malicious cyber-attacks and threats. Privacyrights.org allows consumers to access public information about data breaches around the country. For example, there are multiple articles about data breaches in each state. This will enable customers to know how they're affected by data breaches and what procedures can be taken to ensure their information is not being used or compromised.

Researchers can use this information in a determinism aspect as to what threat actors can take approaches to prevent and mitigate the risk of cyber attacks.
