<div align="center">Bounty Hunting for Hackers</div>

While reading the article, I learned that these hackers are ethical hackers who can be classified as white hat hackers. A white hat hacker hacks an organization ethically to inform them of their vulnerabilities, what they need to fix, and what software to implement within their databases. It also goes into great detail about Bug Bounties and the significance of public programs rather than private ones because in public programs, it is likely for there to be more hackers, and any HackerOne hacker can access the program, which is essentially better. They found that most hackers do not hack for monetary gain, while newer hackers have malicious interest in their actions.
