

Name: Marylinda Quindara

Occupation: drafter

aspirations: Principal systems engineer

Information about me:

As a drafter, I can make models and create working engineering drawings. I can use Autodesk AutoCAD, inventor, and solid works. I can also use MES and SAP for material search and configuration management. I have a little experience using SAP and MES. I built a couple of cabinets and cables before. My weakness is using power tools; because, I have minimum experience using them. I also work full time at Northrop Grumman. But I will try my best to be available after work for any group activities.

One of my jobs is to monitor TDP and all to monitor and to limit numbers of PDF drawing printed in the floor. Another job that I do is I work on processing all redline and callboard approved by the principal system engineer. Then, I write the process in detail using the O&A in MES and provide on the DCR. Then, each and every level will be signed to different people in the group to buy off the change in the drawing and all the BOMs. This is how my sector in the company manage configuration management and to make sure everybody knows the changes in the drawings and BOM after its initial release.
