Introduction and Expectations

 COM372T

This course is an elective requirement for my minor. I expect this course content and performance of the professor to be on pair with any professor. A lot can happen within a semester, and it is important for the student and professor to stay up to date with communication and assignments. I look forward to this course through the lens of more communication, and other non-STEM related fields. As a Cybersecurity Major in my last year, I have taken any courses that are often technical writing or heavy education the laws and foundations of cybersecurity. Thanks to this I have already created a portfolio as this was required for my capstone. Using WordPress I found the layout easy to use and pretty self-explanatory. During this semester I will also be taking my ePortfilo course so I will be in the middle of professionally designing my portfolio.

For this course I expect that I will be learning how we work alongside the growth of the internet of things. How everything I do is affected by the devices we use. This may be quite important course as I believe it will add another level of complexity to relationships with technology. I look forward to the upcoming projects such as the App Analysis and the Generation like projects as those seem to be more hands one and a way to express myself creatively.

I am hoping aside from discussion posts there will be other ways to interact and communicate with my fellow peers. Even though this is an online class, there are ways I have seen my other professors make learning more fun collectively. In a couple of weeks, I am going to Greece for my first solo trip and this I want for my later projects because I can explain how I will interact with new media during my trip.
