

My internship at 360 IT Partners has been slow but steady and I am getting more into a routine by the week. I can only work on Mondays and Wednesdays so I don't get to do as much as I would like to do but it still works and I can get my internship done. I have taken apart PCs and taken out their RAM sticks and hard drives as they were getting destroyed. We keep all the ram sticks as they can be reused or sometimes employees take them for their personal use as they will be trashed if not used. The SSDs get wiped using quick and simple command prompts and once I wiped those they were also kept aside as they are still good SSDs for a work laptop or small PC. After wiping and destroying some of the PCs I then moved over to the laptops as I would have to reset these employees' laptops almost as a factory reset but instead, I would boot up the startup menu and reset the operating system itself. That would cleanly wipe the employee's profile and the computer can either be reused or trashed if too old or not working. Another interesting thing that I have done was going on-site to a company that was having WIFI issues. We brought out this fancy tool that we call the WIFI Sniffer and essentially all it does is you wave it around almost like a wand and it detects the weak spots of WIFI around a building. It was pretty cool as I had never seen one before. I still do more on-site jobs but a lot of them are more simple jobs like setting up hardware or small cyber hygiene practices for clients.
