CYSE 200T – Write Up

Write Up : Business Components

There are many factors and components that contribute to the success of a business. Each work simultaneously to ensure the safety and running of the business is secure and smooth. These parts play an impactful role in making sure everything is in regulation and support the business and the people working within it.

Identify other components of a business :

Some components of a business can include public relations, legal, and technical support. Public relations are the managers of how an organization's image is presented, how they interact and communicate with their clients or the public, and relations to different media outlets. Legal aspects are to make sure that everything done is cooperative with the law, following regulations, and manages legal risks that can often be overlooked. Technical support is there to help users with their needs regarding system issues, software processes, and hardware if need be.

Where do they “fit” in the organization ?

Each of these components are responsible for reporting to management or those in higher positions, helping to meet standards and goals of the organization. Legal will most likely be a

constant reporter or guidance to those who are running the business, near the “CEO”. Technical support will be in the “operations” sections, reporting upward or across to either “HR” or even “marketing”. Public relations will also be tied to the “CEO” or connected to the technical support areas as well.

Where does IT “fit” in an organization ?

IT and Cybersecurity fits across all the units in an organization. IT supports and backs processes, securing information, and regulation. IT and Cyber connect with each other and those above them to apply new technology solutions or ideas while keeping everything organized.

What are the roles & responsibilities w/in IT ?

They protect systems, monitor threats, help colleagues with technical issues, and manage resources to make the best use of what is given. Responsibilities can range from system maintenance, cybersecurity itself, data management, user support, implementing policies and regulations, and working with others in the business to progress it.

How should IT itself be organized ?

IT should be able to organize and apply cybersecurity, data protection and management, and technical support to bring their business together. IT is essential to a business, it must maintain security, efficiency, and work with the other components of the organization properly. Their functions should not be under one component specifically, but instead spread across multiple and have a quick response to those parts who need.
