

## Journal Entry 3

Researchers can gain a lot of information about how each state differs when it comes to handling breaches. For example, every state has a law that makes sure the individual has to be notified about a breach of data, however, the state does not have to publish breach data. It also covers things such as specific data protection laws in each state. It can also help researchers with covering specific data breaches in the U.S. This is because they have a resource called “Data Breach Chronology.” It shows the total number of breaches since 2002, where they have occurred by state, and has a database that they can purchase which shows the organization that was breached, when it happened, what type of breach etc.
