After watching this TED talk on digital forensics, it made me think more about his career journey and exactly how big the overlap between social sciences and technology really is. Tero began his professional career with a background in commerce, and despite not having formal training in computer science, he transitioned into the field of digital forensics. Digital forensics isn't solely about analyzing data, a big part of it has to do with understanding human behavior. He emphasized that digital forensics investigators must dive deep into the motives and psychology about it, because it can help us pick up on patterns and understand the reason for certain online behavior.
