When looking at websites you can tell which website is reliable and which isn't, there are different ways that you could tell which is a fake website and which will give you the information that you could lean on and be 100% sure that its true. One way is to tell by the link of the site for instance, some websites that ended in .com, .net, .gov, .edu, .org, etc. any website URL with any of these ending are more likely to be reliable and the information on there would be 99% true. [What is Cybersecurity? | IBM](#) , [GitHub: Let's build from here · GitHub](#) , [Phishing Simulation Pricing | CanIphish - Free Phishing Tests](#). these websites are a reliable source compared to The these website gives you reliable information about the idea of what cybersecurity is, these reliable source gives you organizations that they have worked with and have a bond with as along with different coding solutions and for different situations like the second site. It also explains what they're website is for. The last one is a tricky one because there are good fake Phish sites, but the one way that it was possible for me to tell if these were fake sites or not was the lock on the left of the search bar which could confirm that the site is certified. Now adays its harder to come across a scam page not that the technology has improved which makes it easier to detect a fake sited page.
