The Human Factor in cybersecurity

When trying to budget between both training and cybersecurity technology, I would first prioritize the training. Leaving me with 55 and 45. 55 percent of the budget going towards any training that is necessary towards training and 45 percent and whatever is left from the training portion towards technology. The reason being is because these new employees that are coming to this organization and often people are also a weak link one wrong error could put the organization at risk. They are also the future of the organization and the future of society, so making sure that they get the knowledge of how to make important moves and the knowledge of social engineering should be number one, especially if we want a safer and stronger security measures. New employees who have a strong mindset about their responsibilities and new technology there should be less common human errors.
