Digital forensic investigators are individuals who search, analyze and report data which could be presented in the court of law. It is important because many things change in a virtual world and they keep track of the chain of custody virtually. Digital forensic investigators study digital evidence to find why an individual would be motivated to commit an offense. This means that investigators must understand human behavior and communication methods which are basic practices of social science. For example, investigators that are looking into a case in which cyberbullying occurred , they must understand human behavior and patterns to resolve in a manner that is successful.
