Fake Websites can be used for many malicious things such as, information access, spread of virus and misleading information. It targets users that are not aware of the signs that may be obvious to cybersecurity specialists and takes advantage of the access that users may grant. The websites I listed above are among some that have been made to purposely give fake information to users that may not be aware of the facts about the certain subject. The real websites above have things in common like full links, high credibility and reviews. The fake websites are lacking dates, professionalism, credibility and simply give out false information. It is to show how easy it is to be fooled by something that looks real, but is not.
