### Free Write #6

A cyber war is the use of cyber attacks against an enemy state, causing harm or disrupting computer systems. There have been many examples of cyber war with the most recent and current one being the one between Russia and Ukraine. When countries don't get along or agree on something, there is bound to be some kind of war that occurs because of their differences. It is just a part of how this world operates. Some would argue that we are always in a cyber war since there are constantly attacks that take place from companies to nations. It does seem like it because there always seems to be a new cyber attack every time we turn on the news. Cyber attacks occur quite frequently and they are unexpected. The only thing we can do to mitigate the situation is to have stronger security and to learn from previous attacks. However, some would argue that there aren't as many cyber attacks. This could be people not looking at all the attacks that have happened or only looking at certain ones. There are many attacks that often go unreported to the authorities, so we may not be aware of a lot of them.
