

My favorite part about the cyberops event was being able to work on a CTF with friends as a team. We did pretty good for freshman with not much experience with linux and not as much knowledge as some of the other participants. I expected there to be a lot more people attending the event than how many actually showed up. Some of the cryptography, reconnaissance, and discworld haiku challenges were some of the easier CTF challenges, while the reverse engineering challenges were harder than most of the other ones. When I left the event after participating in the CTF for a few hours, my team was in 7th place. Experience with tools or programs the company provides will increase your chances of being able to get a job at that company. Intrusion detection systems and wireshark are a few of the things that you can have experience with to help you in your future.
