

Think about how the description of the cybersecurity analyst job relates to social behaviors. Write a journal entry describing social themes that arise in the presentation.

Charles W. Pridgen

Social behaviors as well as social forces were two social themes I saw arise during Nicole Enesse's presentation. In the beginning of the video, she very briefly touches on the behavior of continuous learning that a cyber security professional should exhibit. She doesn't outright say it, but as an entry level job she mentions a cybersecurity analyst is a great start for your journey to learn cybersecurity. She says that a lot of the time candidates will be offered graveyard shifts, and will help with continuously learning the career. Additionally, Enesse explains how important communication and networking is; these are other aspects of the social behavior theme. Cyber professionals need to be able to effectively communicate, which plays part in connecting with other professionals building your professional network. Another aspect of communicating she talks about is the resume which is an example of written communication. Being able to accurately and effectively inform a future employer about your strengths as a cybersecurity professional will affect whether you land a job or not.

Some of the social forces she touched on were wealth, and geography. Enesse explains to her viewers that not all cities have the same supply and demand of jobs in cybersecurity. Some states have higher demand like New York, Texas, and Virginia to name a few. These different states have different costs of living that will affect where someone may want to live. Even with high pay, the cost of living may be very high as well like in New York. On the other side of the coin, places like Atlanta Georgia where pay is high, and cost of living is low may seem more desirable.
